**Test Organism Abbreviations:**

Cerio = Ceriodaphnia dubia  
Pimeph = Pimephales promelas  
Selanas = Selanastrum capricornutum  
Raphi = Raphidocelis subcapitata  
x-ALL-x = Water chemistry data associated with all organisms.

**Suspect Toxicant Abbreviations:**

Inconcl. = Inconclusive  
Met act pest = Metabolically activated pesticides  
Non-pol org = Non-polar organics

## 2000-2001 Aquatic Toxicity Study Data Key

Test Conclusion Codes:	
Code	Test Conclusions
C8-1	Toxicity was detected. However, since the toxicity was not removed by the C8 column, the toxicity was possibly caused by eluate being added back @ 3x.
C8-2	Toxicity was not completely removed by the C8 column.
C8-3	Toxicity was not removed by the C8 column.
C8-4	Toxicity was removed by the C8 column.
EDT-3	Mortality in high concentration of EDTA ensures that the correct concentration of EDTA was used. The high mortality does not affect the test.
ES-1	No toxicity detected.
ES-2	Some toxicity was lost due to an extended hold time.
ES-3	Toxicity detected.
ES-5	Toxicity detected; however, toxicity appears to be pH-related.
ES-6	Toxicity may have been lost due to an extended hold time.
ES-7	Toxicity was lost due to an extended hold time. Data is inconclusive.
LC-1	Artifactual toxicity PRESENT in control blanks.
LC-2	Control DID NOT meet all EPA criteria for test acceptability.
LC-3	High mortality found in the control blank. No conclusions could be made.
LC-4	No artifactual toxicity present in control blanks.
M-3	Data suggest that the greatest contributor to toxicity was a metal.
M-4	Data suggest that toxicity may be partially contributed to a metal.
M-5	Data suggest that toxicity was due to a metal.
M-6	Data suggest that toxicity was not due to a metal.
MAP-1	Absence in mortality suggests that the toxicity was at least in part due to a metabolically activated pesticide.
MAP-13	Toxicity was detected suggesting that a non-polar organic chemical was responsible.
MAP-14	Toxicity was not detected suggesting that a non-polar organic chemical was not responsible.
MAP-2	Decrease in mortality suggests that the toxicity was at least in part due to a metabolically activated pesticide.
MAP-3	Delay in mortality suggests that the toxicity was at least in part due to a metabolically activated pesticide.
MAP-4	No decrease in mortality suggests that the toxicity was not due to a metabolically activated pesticide.
MAP-6	Data suggest that a non-polar organic chemical was not responsible for the toxicity.
MAP-7	Mortality suggests that toxicity was due to a non-polar organic compound.
MAP-8	Mortality suggests that toxicity was not due to a non-polar organic compound.
